Learning from Australia: Medical Education and Fellowship System

Continuing education and training are crucial for medical students and residents. This seminar explores Australia's medical education system, including fellowships. It will provide insights into training dynamics and opportunities for interaction and cooperation. Attendees will learn about program structures, evaluation methods, and career pathways. This is a unique opportunity for those interested in international medical training collaborations.

Insights into Pediatric Foot and Ankle Conditions: Updates and Surgical Techniques

The second part of this seminar centers on foot and ankle conditions in skeletally immature individuals. We are privileged to welcome a distinguished expert from Australia, who will share their valuable experiences and cutting-edge surgical techniques. This international perspective will allow for a unique comparison of European and Australian approaches to managing these conditions. Updates and innovative strategies will be discussed, offering participants a chance to explore congenital foot pathologies such as tarsal coalition, as well as overuse and traumatic foot and ankle lesions, through interactive discussions. This session provides an invaluable opportunity for those seeking to enhance their skills in pediatric foot and ankle care by bridging the gap between European and Australian best practices.
